

lensing

brand sampler

A prediction lab that bends to fit your data. This sheet collects the marks, the icon family, and the in-product surfaces built on one idea: a generic framework taking the shape of your dataset the way mass curves spacetime.

THE IDEA

The lab takes the shape of your data

Point lensing at a corpus, declare your target, and the whole lab bends to fit. The brand says this without explaining it: a regular framework grid curves around the mass of your dataset, and an Einstein ring lights where the deflection peaks. It is the textbook picture of mass curving spacetime and a literal picture of a framework conforming to your data, in one image.

The concept card — `assets/lattice.svg`. Slate so it reads on light and dark alike; the red → orange → blue velocity ramp is reserved for the mark and brand surfaces. Generated, re-runnable: `make_lattice.py`.

The banner

lensing · framework

a prediction lab that bends to fit your data

The tagline lost its caption. Was ~~"bends around your data, the way mass bends light"~~; now **"a prediction lab that bends to fit your data."** One restrained verb; the physics lives in the mark, not the sentence.

Data, bent — assets/lattice-data.svg. A straight, evenly-spaced row of data points deflected into a lensed arc as it passes the mass.

The Einstein-ring alignment sweep

Full ring → arcs → single arc is a real physical progression, so each stage of the pipeline carries a different alignment state. Stroke inherits `currentColor`; `--brand-src` tints the source dot. They feed the app's empty-state mark and external surfaces — they do **not** replace the text-monogram glyphs the app uses for runs, datasets and models.

dataset

the ring forms — a frozen
featurization contract

run

a live arc lights up — training in
progress

model

locked: full ring, solid mass — a
promoted model

predict

one source resolved into a bright
arc and its image

compare

two arcs, two images held side by
side

export

a ray leaves the lens — the model,
portable

Empty states, and how it forms

No data yet

Every empty state opens with the lattice — monochrome here, because the one orange on the screen belongs to its primary button. The ring draws in on mount; reduced motion holds it.

FLAT

DATA ARRIVES

FORMED

Motion study — the grid starts flat, the dataset arrives, the grid bends to fit and the ring lights, then it loops. [branding/explore/animated.html](#).
